 ✓ Animal 1

 ✓ fields

 + name

 + species

 > Species

 DataElement

DataElementHasInfoFieldRule

Missing Defaults

A data element should have at least one info field. Without any info fields, no data will be visible in the UI tables.

<DataElement animals::Animal> has no isInfoField field

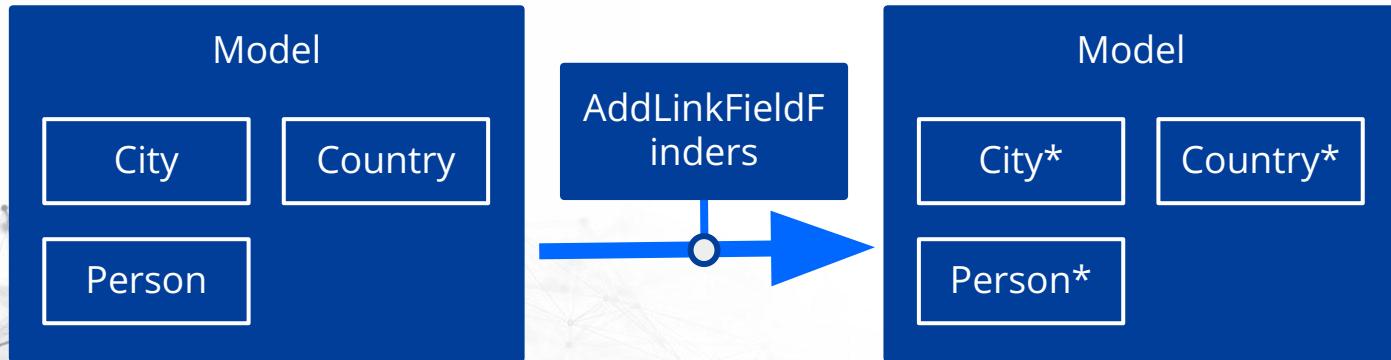

❖ Validations

Custom Rules

```
@ValidationRule(  
    element = "elements::Field",  
    severity = ValidationSeverity.SUGGESTION,  
    reason = "Field names should start with lowercase letters.",  
    description = "The first two letters of a Field's name should be lowercase characters."  
)  
@ValidationGroup("Naming")  
public class FieldNamingRule implements ValidatableRule<FieldComposite> {  
    public void validate(FieldComposite field, Critiques critiques) {  
        String name = field.getName();  
        if (name.length() == 0 || !Character.isLowerCase(name.charAt(0))) {  
            critiques.add(field, "{element} name must start with lowercase letter");  
        }  
        if (name.length() >= 2 && Character.isUpperCase(name.charAt(1))) {  
            critiques.add(field, "{element} name's second character must be lowercase");  
        }  
        if (name.contains("_")) {  
            critiques.add(field, "{element} name should not contain underscores");  
        }  
    }  
}
```

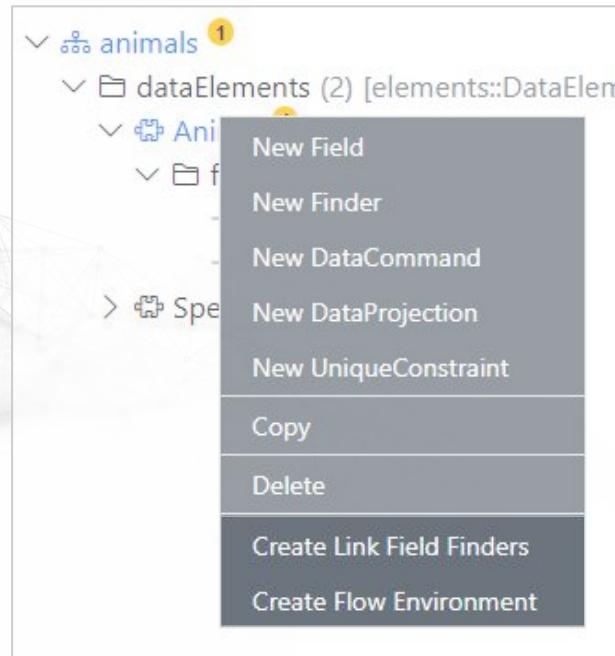

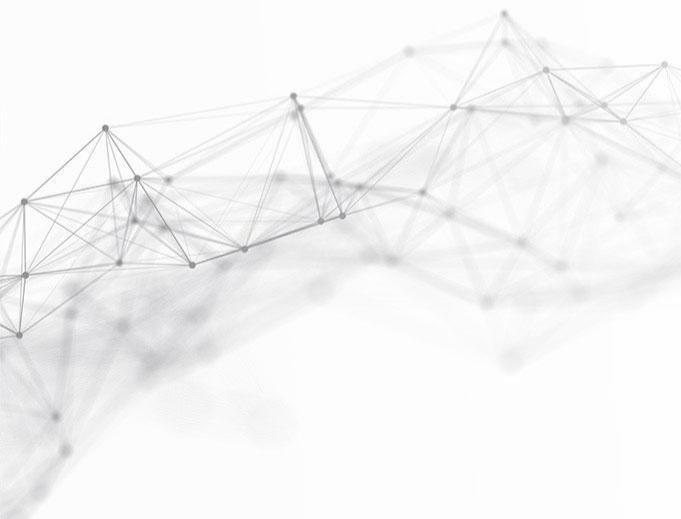

❖ Transmutations

❖ Transmutations

Integrated in µRadian

❖ Transmutations

Custom Transmuter

```
@Transmutation(
    element = "elements::DataElement",
    description = "Adds a FlowElement and status field to the target DataElement"
)
public class CreateFlowEnvironment implements ModelTransmuter<DataElementComposite> {

    @Override
    public void transmute(DataElementComposite dataElement, ModelTransmutationContext context) {
        ComponentCompositeBuilder merge(dataElement.getComponent(), context, comp -> {
            comp.flowElements(flowElement -> {
                flowElement.name(dataElement.getName() + "Flow");
                flowElement.packageName(dataElement.getPackageName());
                flowElement.statusField("status");
                flowElement.targetClass(dataElement.getPackageName() + "." + dataElement.getName());
            });
        });
    }
}
```

ModelLoader

ModelLoadingListeners

❖ ModelLoadingListeners

```
<modelLoadingListeners>
  <modelLoadingListener name="net.democritus.expander.OidcOptionTransformer">
    <modelLoadingStep name="EnrichModelStep"/>
    <implementation>net.democritus.expander.OidcOptionTransformer</implementation>
  </modelLoadingListener>
</modelLoadingListeners>
```

```
public class OidcOptionTransformer implements ModelLoadingStepListener<EnrichModelResult> {

  @Override
  public void afterStep(EnrichModelResult result, ModelLoadingContext context) {
    //...
  }
}
```

Expanders

Cleanup

- Vector 💀
- new Long(String) 💀
- Long.longValue() 💀
- Java 7 💀 → Java 17 (Java 21 LTS in september 2023)
- new Long(0) 💀
- Legacy methods 💀
- EngineService#collector 💀
- *target.element.projection / target.class.custom* replaces targetClass 💀

Expanders

Improvements

- Cached Workflow Configuration
- DetailsWithoutRefs Projection
- StateTask timeout
- *Run now* button for workflow
- Finder *in* operator
- ContextRetriever allows Context updates in Control Layer
- *myComp.ns.properties* file

Expanders

Improved Model Loading Errors

```
net.democritus.elements.ElementNotFoundException: Cannot find Field(registration::Person::Status)

    at FlowElementTreeToComposite.getStatusField (statusField=Status, targetElement=<DataElement registration::Person>)
    at FlowElementTreeToComposite.mapTree (tree=<FlowElement registration::PersonFlow>)
    at ComponentTreeToComposite.mapFlowElement (flowElement=<FlowElement registration::PersonFlow>)
    at ComponentTreeToComposite.mapTree (tree=<Component registration>)
    at ModuleCompositeModelLoader.loadModules (moduleType=<ModuleType elements::JeeComponent>)
    at ExpansionCompositeModelConverter.convert (program=<Application demo::1.0.0>,
programType=<ProgramType elements::JeeApplication>)
    at ModelLoader.performStep (step=ConvertModelStep)
    at ModelLoader.loadModel (expansionSettings=F:\NSF\workspace\demo\conf\expansionSettings.xml)
```

❖ Expanders

Unique Constraints

The screenshot shows the pRadiant application interface with the title bar "demo" and "reload". The left sidebar displays a tree view of the project structure under "demo:1.0.0":

- cars** (2)
- dataElements** (3) [elements::DataElement]
 - Car** (1)
 - fields** (4) [elements::Field]
 - + licensePlate: String
 - + carBrand: CarBrand[Ln01]
 - + notes: StringLong
 - + status: String
 - finders** (2) [elements::Finder]
 - + findByCarBrandEq
 - + findByStatusSe
 - uniqueConstraints** (1) [elements::UniqueConstraint]
 - licensePlate

❖ OptionTypes

Define OptionTypes in expansion-resources

- Enumerate valid ElementType
- Value (no value/required/regex)
- Cascade
- Alias
- Deprecate (with validUntil)
- Always enabled (with default value)

```
<optionType name="ejb3.useEjbInControl">
  <description>
    Adds ejb3.1 as a technology
    to the control layer together with
    a dependency on `javax:javaee-api`.
  </description>
  <elementTypes>
    <elementType component="elements"
      name="Application"/>
    <elementType component="elements"
      name="ApplicationInstance"/>
    <elementType component="elements"
      name="Component"/>
  </elementTypes>
  <valueConstraint>
    <noValue>true</noValue>
  </valueConstraint>
</optionType>
```

❖ TestModelBuilder

Replaces ModelSpecBuilder to add integration with ModelLoader

- Includes ModelLoadingListeners
- Supports OptionType cascade, alias ...

```
ModelSpecBuilder specBuilder=  
    new ModelSpecBuilder();  
return specBuilder.buildAndFind(  
    component("testComp",  
        dataElement("City")),  
    dataElement("testComp::City"));
```

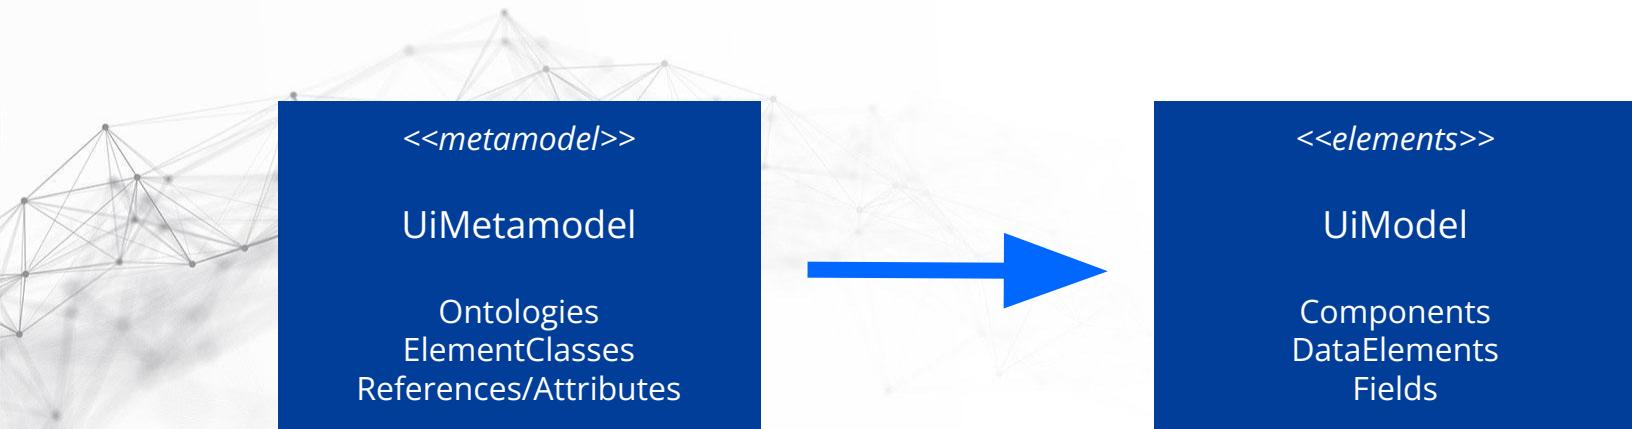

```
TestModelBuilder modelBuilder=  
    new TestModelBuilder();  
return modelBuilder.buildModelAndFind(  
    component("testComp",  
        dataElement("City")),  
    dataElement("testComp::City"));
```

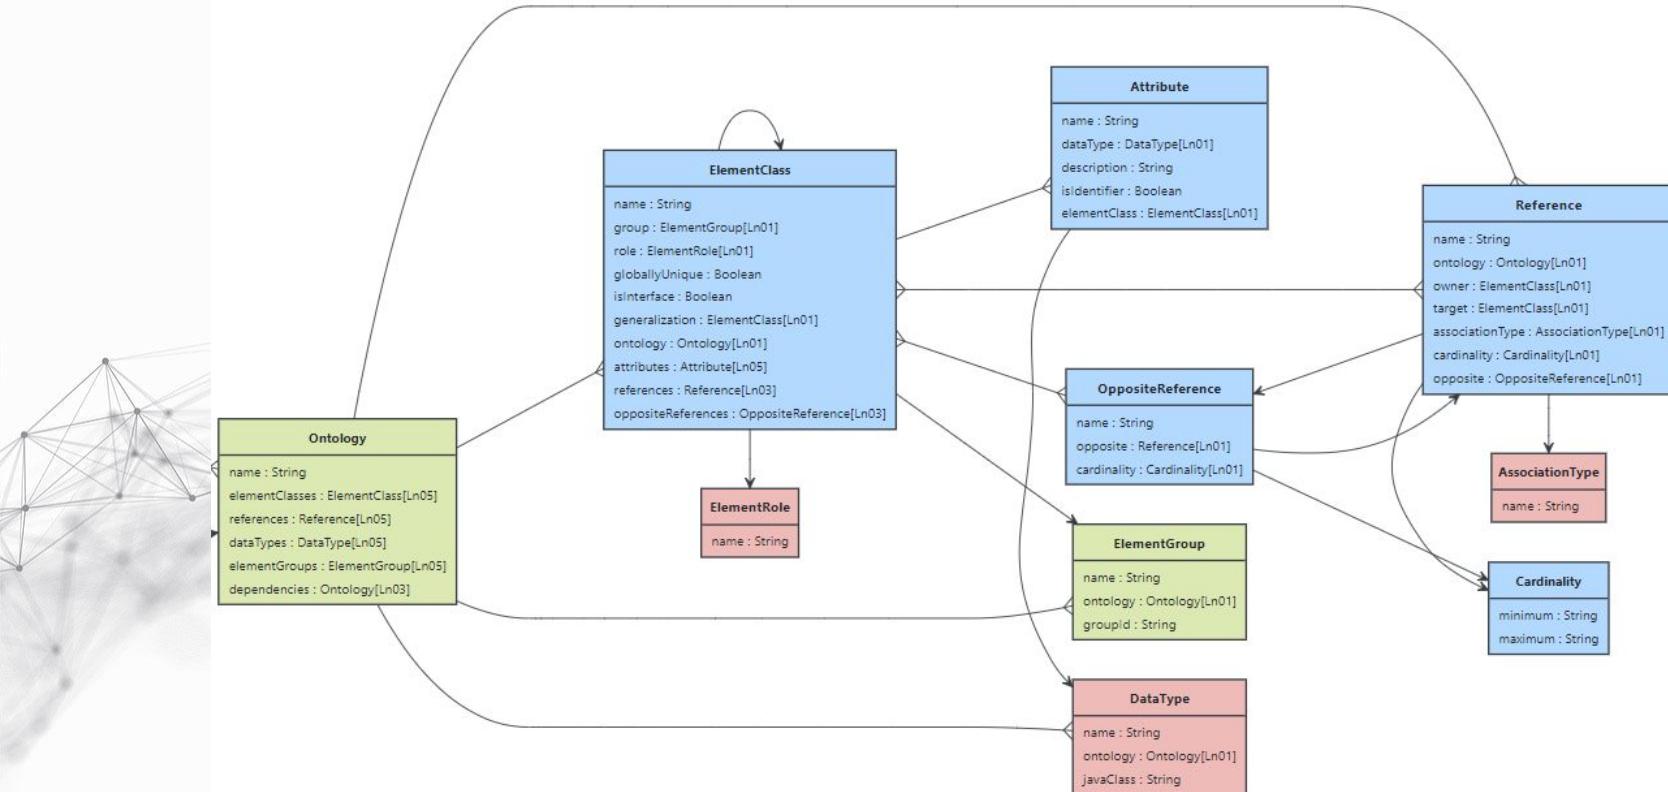

Metamodels

- Designed for creating metamodels
- Can better represent bi-directional Relationships
- Supports inheritance with Polymorphic Interfaces

❖ Metamodels

    OrderUpdate "1" --> "6" Message
    RefundRequest "1" --> "7" Message
  
```

❖ NS Scripting

Platform independent scripts for NS development processes

- Based on the Kotlin language engine
- Simplified scripting syntax inspired by Jenkins
- Platform independent commands
 - Platform specific tooling resolution
- API tailored to NS project development
 - Expanders, Maven, Git, ...
- Scoped contexts (e.g. directory scoping)
- 2023: Script argument API, NS project I/O, ...

```
#!/usr/local/bin/env nss

ns {
    expand {}
}

dir("expansions/myApp") {
    mvn {
        task("clean")
        task("package")
    }
}
```

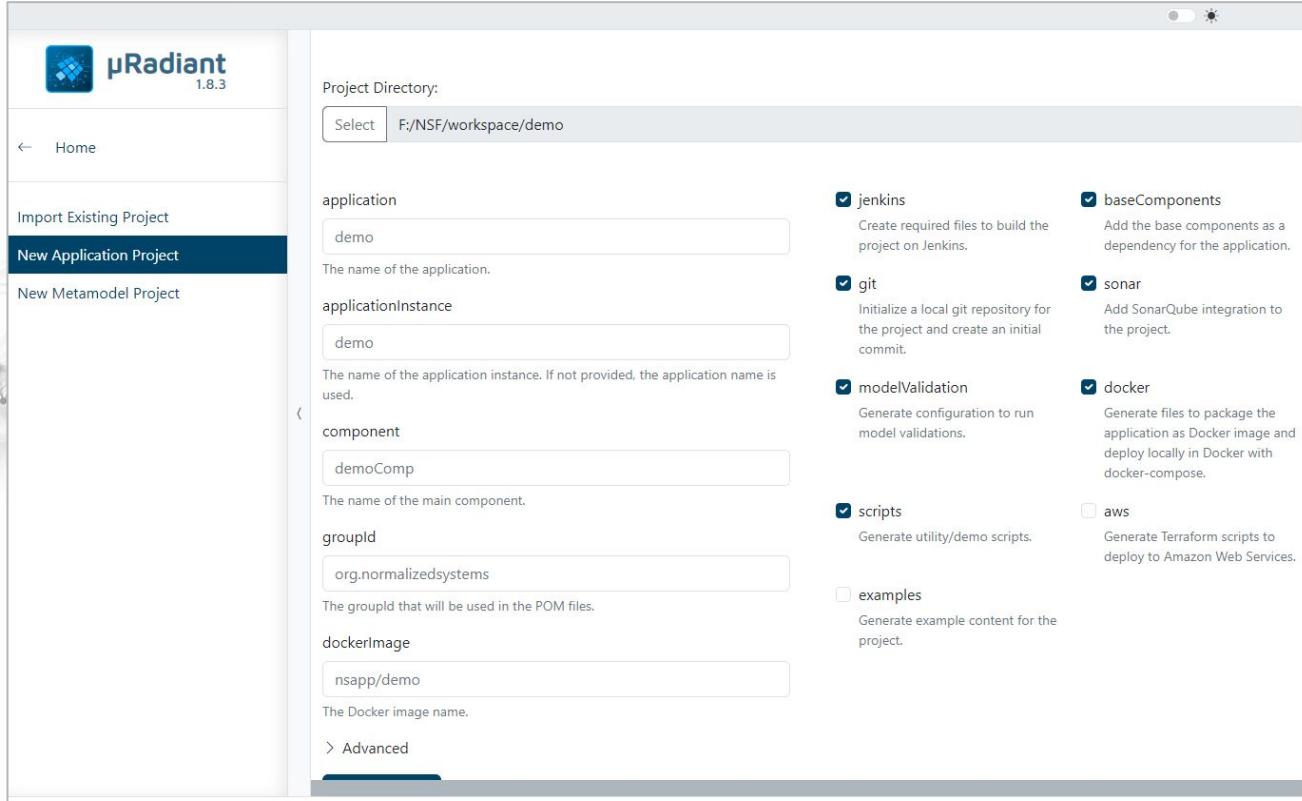

NS Initializer

Evolution

NS Initializer

μRadiant Integration

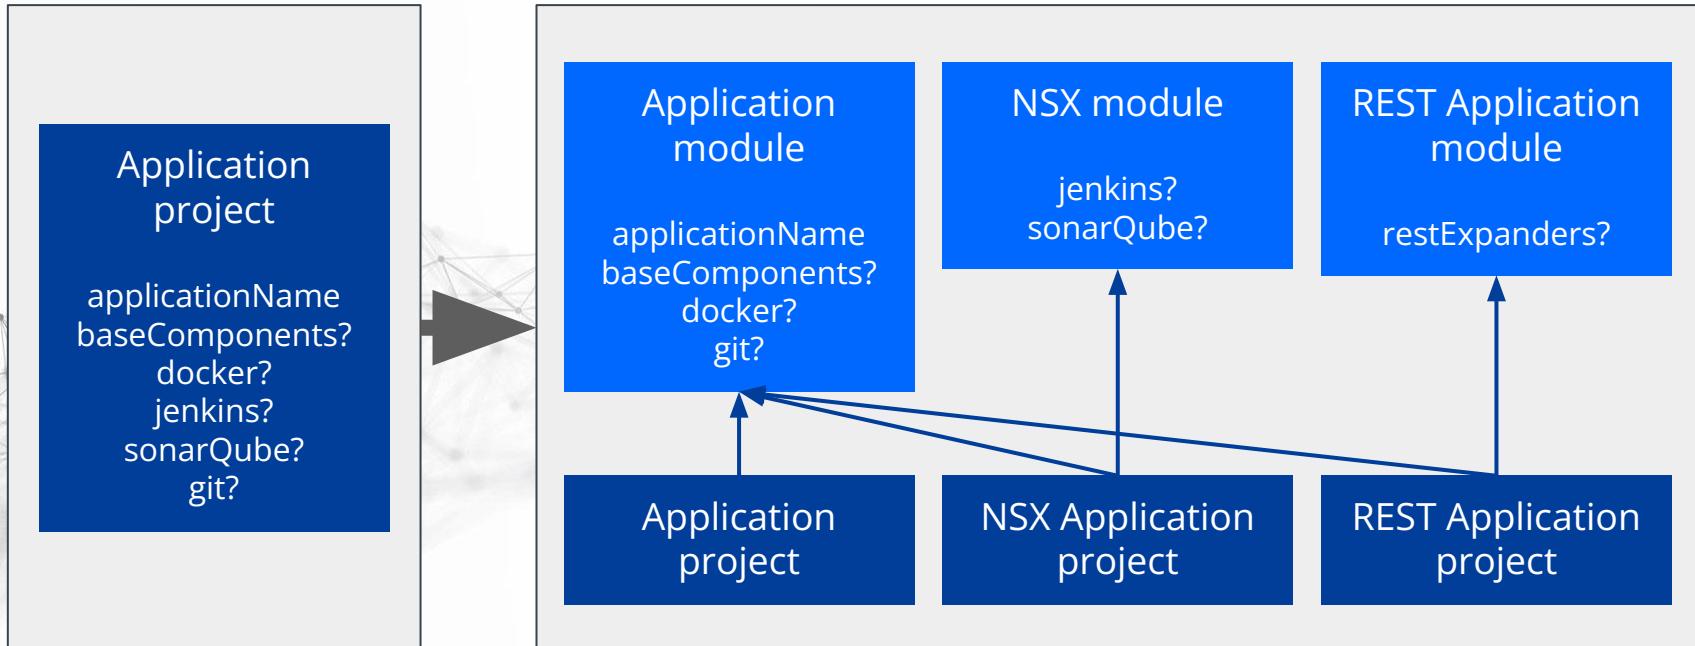

The screenshot shows the μRadiant application interface for initializing a new project. The left sidebar has buttons for Home, Import Existing Project, New Application Project (which is selected), and New Metamodel Project. The main area is titled "New Application Project" and contains fields for "Project Directory" (set to F:/NSF/workspace/demo), "application" (set to demo), "applicationInstance" (set to demo), "component" (set to demoComp), and "groupId" (set to org.normalizedsystems). On the right, there are several checkboxes for generating project components:

- jenkins: Create required files to build the project on Jenkins.
- git: Initialize a local git repository for the project and create an initial commit.
- modelValidation: Generate configuration to run model validations.
- scripts: Generate utility/demo scripts.
- examples: Generate example content for the project.
- baseComponents: Add the base components as a dependency for the application.
- sonar: Add SonarQube integration to the project.
- docker: Generate files to package the application as Docker image and deploy locally in Docker with docker-compose.
- aws: Generate Terraform scripts to deploy to Amazon Web Services.

NS Initializer

Planned: Project modules

Docker images

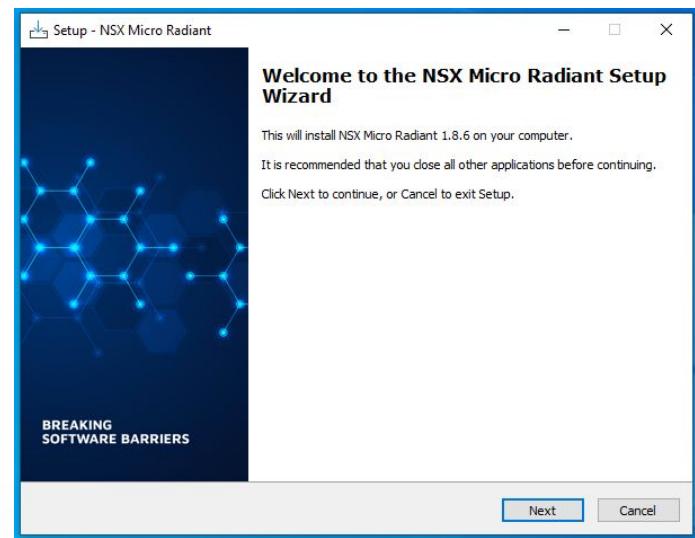

Simplified and consistent releases

Tag	Example	Fixed	Description
latest	latest	✗	The latest version of the image, latest supported version of JRE and latest version TomEE.
<tomee-major-version>	8	✗	The latest version of the image, latest supported version of JRE and latest major version TomEE.
<tomee-version>	8.0.13	✗	The latest version of the image, latest supported version of JRE and fixed version TomEE.
<tomee-version>-<image-version>	8.0.13-2.13.0	✓	A fixed version of the image, latest supported version of JRE and Fixed version TomEE.

❖ Product development

- More internal and external users
 - Increase UX and accessibility of tooling
 - Better documentation
 - Simplified distribution and setup of tooling
 - Windows installers
 - Ubuntu packages
 - Chocolatey packages

BREAKING SOFTWARE BARRIERS

NS Application Development relies on 4 principles, based on engineering concepts such as system theoretic stability and thermodynamic entropy, to create evolvable software.

Principle	Description
Data Version Transparency	Data structures can have multiple versions without affecting the processing functions that consume or produce them.
Action Version Transparency	It should be possible to upgrade a processing function without affecting processing functions that call it.
Separation of Concerns	A processing function should not address more than one concern and should thus not include more than one task.
Separation of States	Tasks should clearly expose the state of their execution, so that errors can be correctly attributed to their causes.

QR code

New Foundation

- Deprecated content pruned
- Improved/rewritten existing content
- Centralized all official documentation
- Blog with release notes and migration guides
- Powerful search functionality:
 - Carefully indexed
 - Weighted results
 - Includes Maven plugin documentation

A screenshot of a search interface with a search bar at the top containing the text "expander". Below the search bar is a list of search results. The first result is a blue header card titled "Making the Expander Conditional". Below this are three standard list items: "Not all expanders and features should be applied to each element", "Creating a New Expander", and "When you have the latest version of the nsx-support plugin , you". At the bottom of the interface, there is a navigation bar with icons for selecting, navigating, and closing, and a search bar for "typeSense".

Developing Expanders
